# **15mw generator air outlet temperature**

## Overview

---

Cooling systems are designed to provide adequate cooling for full load operation at a specified ambient air temperature typically between 40C° (104F°) and 50C° (122F°). Factors such as climate and direction of prevailing winds must be considered in an outdoor installation. If your generator is expected to be in temperatures lower than -20 o F (-29 o C) consult the. When specing a generator set with an enclosure for use in a hot climate, outside air temperature defines the ambient capability. The difference between them is the temperature rise of the coolant.

### Air-cooled generator inlet

## temperature

In this method of cooling, inlet air to the compressor is cooled from ambient temperature to a lower temperature by means of an "ammonia-water" vapor absorption

## The hazards of high generator air outlet temperature

This information discusses how very high ambient temperatures impact generator performance, service considerations to ensure reliability, and changes that may have to be made to existing
