Can photovoltaic panels be used for direct heating

Overview

Connecting a solar panel directly to a heater allows the electrical energy harvested from sunlight to be directly converted to heat. However, there are important factors like voltage, power. The short answer is yes, solar panels can heat a house. But the “how” is more interesting than a simple yes or no. It involves two distinct technologies with different price tags and efficiencies. From research I see an MPP would improve output but I got the panels for free and all I want to do is heat one of my three barrels in a small greenhouse to increase the amount of radiant heat.
