DC arcing phenomenon in photovoltaic panels

Overview

Most PV DC arc faults are series arcs across a high-resistance gap. Series arcs often show wideband current noise, typically concentrated between 1 kHz and 100 kHz, superimposed on the DC string current. This paper focuses on the understanding of how photovoltaic (PV) technology behaves under dc arc conditions. Emphasis is placed on the electrical safety aspect of DC arc flash incident. This report provides an overview of arc-flash hazard in terms of incident energy and arc-flash energy on photovoltaic equipment. The experiment site is a utility-owned ground-mount photovoltaic plant with a 1-MWdc nameplate capacity located at Sturbridge, MA. The paper gives an overview of arc detection methods proposed in literature and presents a preliminary experimental characterization of the arcing current, focusing the attention on series arcs, whose.
