Overview

In modern communication networks—from 4G and 5G to future 6G—mobile base stations form the backbone of wireless connectivity. DC power systems for telecommunications provide steady energy for telecommunication facilities. They convert alternating current into direct current to prevent interruptions. Telecommunications Systems Overview Telecommunications systems deliver many of the communications services we rely on daily, including the. Main Base Station Equipment Often referred to as the brain center, this includes: Baseband Unit (BBU): Handles baseband signal processing. Active Antenna Unit (AAU): Integrates RRU and antenna for 5G-era efficiency. Power factor corrected (PFC) AC/DC power supplies with load sharing and redundancy (N+1) at the front-end feed dense, high efficiency DC/DC modules and point-of-load converters on the back-end. A power efficient design is required that supplies both the higher voltage analog circuits and multiple.
