Final demand for energy storage batteries

Overview

Benchmark expects the market to expand by roughly 44 percent this year, nearly doubling the growth rate of overall lithium-ion battery demand, which is projected at 25 percent. EVs accounted for over 90% of battery use in the energy sector, with annual volumes hitting a record of more than 750 GWh in 2023 – mostly for passenger cars. The projections are developed from an analysis of recent publications that include utility-scale storage costs. With demand for energy storage soaring, what's next for batteries—and how can businesses, policymakers, and investors. This battery storage update includes summary data and visualizations on the capacity of large-scale battery storage systems by region and ownership type, battery storage co-located systems, applications served by battery storage, battery storage installation costs, and small-scale battery storage. China is on target to add 100GW of new energy storage capacity over 2025-27, more than doubling total capacity to 180GW by the end of 2027 compared with 2024, according to a government action plan issued in September.
