## Overview

---

Localized energy systems, known as microgrids, can operate independently or in conjunction with the main electrical grid. A microgrid is a local electrical grid with defined electrical boundaries, acting as a single and controllable entity. [2][3] Microgrids may be linked as a cluster or operated as stand-alone or isolated microgrid which only operates. Authorized by Section 40101(d) of the Bipartisan Infrastructure Law (BIL), the Grid Resilience State and Tribal Formula Grants program is designed to strengthen and modernize America's power grid against wildfires, extreme weather, and other natural disasters that are exacerbated by the climate. A microgrid, in short, is a localized energy system that can operate independently or in connection with the main electric grid. Department of Energy (DOE), it is a controllable entity managing distributed energy resources (DERs) and loads with a defined boundary, capable of. Microgrids are small-scale power grids that operate independently to generate electricity for a localized area, such as a university campus, hospital complex, military base or geographical region. The US Department of Energy defines a microgrid as a group of interconnected loads and distributed. Within the commercial and industrial renewable energy sector, few terms have garnered more attention lately than the system label 'microgrid'. This article aims to provide an overview of microgrid fundamentals: what a microgrid is and what a microgrid can do.
