Grid connection policy for new energy storage projects

Overview

A Practice Note discussing the process of connecting an energy generating or battery storage facility to the electric grid and the legal and regulatory framework applicable to the interconnection process. This Note also discusses key issues that developers and investors should consider when.

Interconnection costs have risen and are highest for wind, solar, and battery storage projects. IREC works in states across the country and through national forums to make connecting to the grid more. Energy storage is expected to play an increasingly important role in the evolution of the power grid particularly to accommodate increasing penetration of intermittent renewable energy resources and to improve electrical power system (EPS) performance. To understand what could drive future grid-scale storage deployment, NREL modeled the techno-economic potential of storage when it is allowed to independently provide three grid services: capacity, electric.

Interconnection 101 - Fact Sheet , ACP

Interconnection is the set of rules that new electricity generators--wind, solar, gas, energy storage, nuclear, or otherwise--must follow to connect to the electric grid and deliver energy to customers.

State interconnection standards govern the process for connecting solar, battery storage, and other clean energy resources to the electric grid. Interconnection rules dictate how efficient and costly it is to install a grid-connected clean energy system. If the process is slow, expensive, and/or unpredictable, it can impede investment and prevent a See more on irectusa nist.gov[PDF]
