# **How many energy storage devices are needed for one kilowatt-hour of electricity**

## Overview

---

In general, 1 kilowatt-hour (kWh) signifies the storage capacity sufficient to power a 1,000-watt appliance for one hour, or alternatively, a 100-watt appliance for 10 hours. An energy storage system (ESS) for electricity generation uses electricity (or some other energy source, such as solar-thermal energy) to charge an energy storage system or device, which is discharged to supply (generate) electricity when needed at desired levels and quality. ESSs provide a variety. Kilowatt-hours (kWh) measure energy capacity. Because of that, the right storage size depends entirely on your use case. The first battery, Volta's cell, was developed in 1800. If you want to know how many kilowatt-hours (kWh) of electricity the devices uses. In this work we describe the development of cost and performance projections for utility-scale lithium-ion battery systems, with a focus on 4-hour duration systems. The projections are developed from an analysis of recent publications that include utility-scale storage costs.
