Microgrid operation evaluation

Overview

To comprehensively and accurately assess the operational efficiency of microgrids and develop an effective means for promoting the sustainable and scalable development of microgrids in port areas, an applicable evaluation index system and comprehensive evaluation. To comprehensively and accurately assess the operational efficiency of microgrids and develop an effective means for promoting the sustainable and scalable development of microgrids in port areas, an applicable evaluation index system and comprehensive evaluation. This paper presents the controller- and power-hardware-in-the-loop (HIL) evaluation platform built to enable site-specific evaluation for a microgrid as well as the test cases used to evaluate the operation of a microgrid controller for a specific site. Finally, this paper presents the results. NLR develops and evaluates microgrid controls at multiple time scales. Our researchers evaluate in-house-developed controls and partner-developed microgrid components using software modeling and hardware-in-the-loop evaluation platforms. The proposed microgrid features a combination of hybrid energy resources, which include power, heat, and hydrogen systems.
