## Overview

---

In contrast, microgrids are decentralized systems. They generate electricity from multiple local sources—such as solar panels, wind turbines, or generators—store it in batteries, and are managed with local controls. This allows them to operate autonomously or in connection with the grid. Authorized by Section 40101(d) of the Bipartisan Infrastructure Law (BIL), the Grid Resilience State and Tribal Formula Grants program is designed to strengthen and modernize America's power grid against wildfires, extreme weather, and other natural disasters that are exacerbated by the climate. A microgrid is a group of interconnected loads and distributed energy resources that acts as a single controllable entity with respect to the grid. Microgrids can improve customer reliability and resilience to. Energy microgrids can be the pillar on which smart energy structures and smart grids, including energy systems using multiple energy carriers, will be based. Unlike traditional power systems that depend on a centralized grid, microgrids can operate independently, making them especially resilient. A Battery Energy Storage System (BESS) is essentially a rechargeable container for electricity. It stores energy when it's abundant (like from midday solar) and releases it when it's needed most (like during evening demand spikes or outages). But it's more than just backup power.
