# **Photovoltaic self-generation and self-use of surplus electricity storage**

## Overview

---

The present paper proposes a methodology to optimize the self-sufficiency and the self-consumption, or the economic return, of a PV storage system. The integration of self-generation and energy storage solutions holds tremendous potential for transforming the way we produce, distribute, and consume energy. In the optimal sizing procedure, a limitation on the maximum injection in the grid can affect the. This paper introduces an approach towards a system design for improved PV self-consumption and self-sufficiency. As a result, a polyvalent heat pump, offering heating, cooling and domestic hot water, is considered alongside water storage tanks and batteries. For operators, the aim is to encourage solar.
