## Overview

---

The devices boast a gravimetric energy density of 711.65 Wh/L, both of which are the highest in rechargeable lithium batteries based on an intercalation-type cathode, Li tells Physics World. Critical for portable, wearable, medical, and aerospace devices, where every gram counts. Typical Li-ion cells achieve 150–250 Wh/kg and 350–700 Wh/L, outperforming lead-acid and nickel-based alternatives. High-energy chemistries like NMC (Nickel Manganese Cobalt) prioritize capacity. (gravimetric) and 280 Wh L<sup>-1</sup> (volumetric). In comparison with other lithium-ion cell is graphite made from carbon. The energy density is 370 Wh kg<sup>-1</sup>. What exactly is the energy density of lithium ion battery, why is it so important, and what factors influence it?
