Suspended gravity energy storage generator

Overview

In a gravity battery, a mass is displaced, or lifted, to generate gravitational potential energy that is transformed into electricity. In a common application, when renewable energy sources such as wind and solar provide more energy than is immediately needed, the surplus is used to lift a mass. Designed by University of Waterloo researchers, the solid gravity energy storage system is claimed to be suitable for storing renewable energy. The system combines façade-mounted PV panels, small rooftop wind turbines, Li-Ion batteries, and a rope-hoist-based gravity energy storage (GES). According to a recent announcement from Energy Vault Holdings and Skidmore, Owings & Merrill (SOM), architects and engineers are planning to construct 1-km-tall (3,280 feet) buildings that harness their dizzying heights for gravity-based energy generators and batteries. Gravity energy storage technology (GES) depends on the vertical movement of a heavy object in a gravitational field. This document discusses application practices, and potentials. When surplus electricity is available, it is used to lift weights.
