The principle of solar power generation in the Science and Technology Museum

Overview

The Sun is powered by a process called fusion, where lightweight particles fuse together to release energy. Energy released this way at the core of the Sun takes 100,000 years to rise to its surface before it is emitted into space in all directions as light radiation. The Sun is at the centre of the swirl of planets, moons, asteroids and dust that make up our solar system. Solar technologies convert sunlight into electrical energy either through photovoltaic (PV) panels or through mirrors that concentrate solar. Italic (PV), or indirectly using concentrated solar power (CSP). Major emphasize has been on solar photovoltaic (PV) and concentrated. The two dissimilar semiconductors possess a natural difference in electric potential (voltage), which causes the electrons to flow through the external circuit, supplying power to the load. From the atomic dance inside semiconductors in a solar panel to the massive turbines spinning in the wind, physics sits at the heart of renewable energy.
