The voltage output of 220v inverter is 270v

Overview

An device classified as a 270V power supply transforms AC (AC) or DC (DC) from the primary power source into a constant output voltage of 270 volts. The voltage at this level is essential for the correct operation of equipment requiring a stable power supply, including health care. Had an output of 11. I have bifacial panels at a not-ideal angle for winter time production (Eastern Canada, about 25'ish degrees, we have high coastal winds here especially coming from the North). 2 strings of 13s, have been considering taking a panel out just to be on. Bulgarian mains is nominally 230 VAC 50 Hz and 220 - 240 VAC would be expected. For heating power rises with v^2 . What is a 12V to 240V inverter?

A 12V to 240V inverter is a pivotal device designed to convert direct current (DC) power from a 12-volt battery into alternating current (AC) power with a nominal output. It describes the output voltage of an inverter, which converts direct current (DC) from sources like batteries or solar panels into alternating current (AC). The modulation index represents the ratio. The default, which should be 230V, or do you adjust it down to 220V, or up to 240V?

Why the question?

Well, this is where my thought comes from: Could some appliances use less electricity (Read: Watts / Wh) if it runs at a higher voltage?

Most electronics don't have advanced MCU's and algorithms. The power of the battery is 360W (12V x 30A= 360W).
