Theoretical basis for energy storage system selection

Overview

Here, we propose a multi-criteria decision-making (MCDM) framework for selecting a suitable technology based on certain storage requirements. From large-scale solutions like pumped hydro and compressed air energy storage to distributed technologies such as batteries and hydrogen fuel cells, the role of storage is expanding beyond merely being a back-up: it is becoming an integral component of modern power systems. Decarbonization is a crucial step towards a sustainable future, and renewable energy plays a vital role in making this transition. Abstract: Energy storage technologies can reduce grid fluctuations through peak shaving and valley filling and effectively solve the problems of renewable energy storage and consumption. These systems are categorized by their physical attributes.
