# **Wind power generation facing the sea**

## Overview

---

Here's the latest: Global offshore wind capacity reached ~100 GW by mid-2025, with floating wind growing modestly. Vessel shortages, specially WTIVs and feeder barges remain the top logistical challenge. As massive wind farms rise offshore, maritime shipping is feeling the ripple effects—from altered shipping routes and new vessel demands to economic. As towering turbines rise from the depths of our coastal waters, a new chapter in renewable energy unfolds along the world's shorelines. The amount of available energy is determined by the mechanical. Most of today's offshore wind farms are fixed directly to the seabed and provide electricity directly to the grid. These fixed-bottom offshore wind farms, along with promising new types of wind farms, like floating and hydrogen-integrated, may reflect the future of what offshore wind in the United. In 2026, they are transforming how we harness wind energy—far beyond the coastline, in deep ocean waters where winds are stronger and more consistent.
