Wind power grabs power generation

Overview

Wind turbines use blades to collect the wind's kinetic energy. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. A wind power class of 3 or above (equivalent to a wind power density of 150–200 watts per. Wind power or wind energy is a form of renewable energy that harnesses the power of the wind to generate electricity. Harnessed through the mechanical motion of wind, this energy is transformed into electricity in a process that is both innovative and ecologically beneficial.

Wind power grabs power generation

How is electricity generated using wind?

How does wind produce energy? It's a fairly simple process: When the wind blows, the turbine's blades spin which captures energy. This energy is then sent through a gearbox to a generator, which ...
